Factsheet

Wastewater Pump Station Renewal

Banksia Avenue, Noosa Heads

About this project

Unitywater is upgrading an existing pump station in your area to improve efficiency and support the ongoing performance of the wastewater network. These essential works will help ensure wastewater services continue to operate safely and reliably for the local community.

Why we are doing it

The Banksia Avenue pump station is a key part of the wastewater network serving homes and businesses in the Noosa area.

After nearly 30 years of operation, the pump station is being upgraded to renew key components and enhance performance.

What we are doing

- Removing minimal vegetation, including some trees within the pump station site, to safely access the area and install new infrastructure.
- Constructing a new enclosure to house modern electrical equipment with increased capacity. The new switchroom will be painted to blend in with its surroundings.
- Installing new, larger pumps to improve reliability.
- Installing new internal support equipment, including guide rails and pump pedestals, to improve safety and performance.
- Upgrading access points and safety features, including fall protection within the pump station.
- Installing improved seals around access lids to support long-term odour management.
- Restoring disturbed areas, including new landscaping in front of the road verge, once construction is complete.
