# MESSAGE FROM THE CEO

Dear Customers,

Each year Unitywater publishes this report to set out transparently information about the quality of the drinking water we supply. I'm pleased to confirm that during 2014-15 the water supplied to our customers remained of a very high standard and, as in previous years, met all regulatory requirements.

Unitywater continues to meet the requirements set by the Queensland Public Health Regulation for drinking water, with 99.9% of all samples free of *E. coli*, an indicator of possible contamination. Meeting this requirement demonstrates that you can continue to have confidence in the water supplied by Unitywater to your home, school and work place. To maintain that confidence Unitywater sampled and completed almost 100,000 individual water tests. Of those only five did not meet an individual guideline. Each of these was investigated promptly and successfully met the guideline when retested.

We recognise that having confidence in the quality of the water you drink is just as important as the quality of food you eat. Unitywater will build on the Queensland and Australian standards we already meet to obtain international recognition, namely ISO 22000. To meet this international accreditation we must demonstrate to independent assessors our ability to identify and control safety hazards throughout the water supply chain.

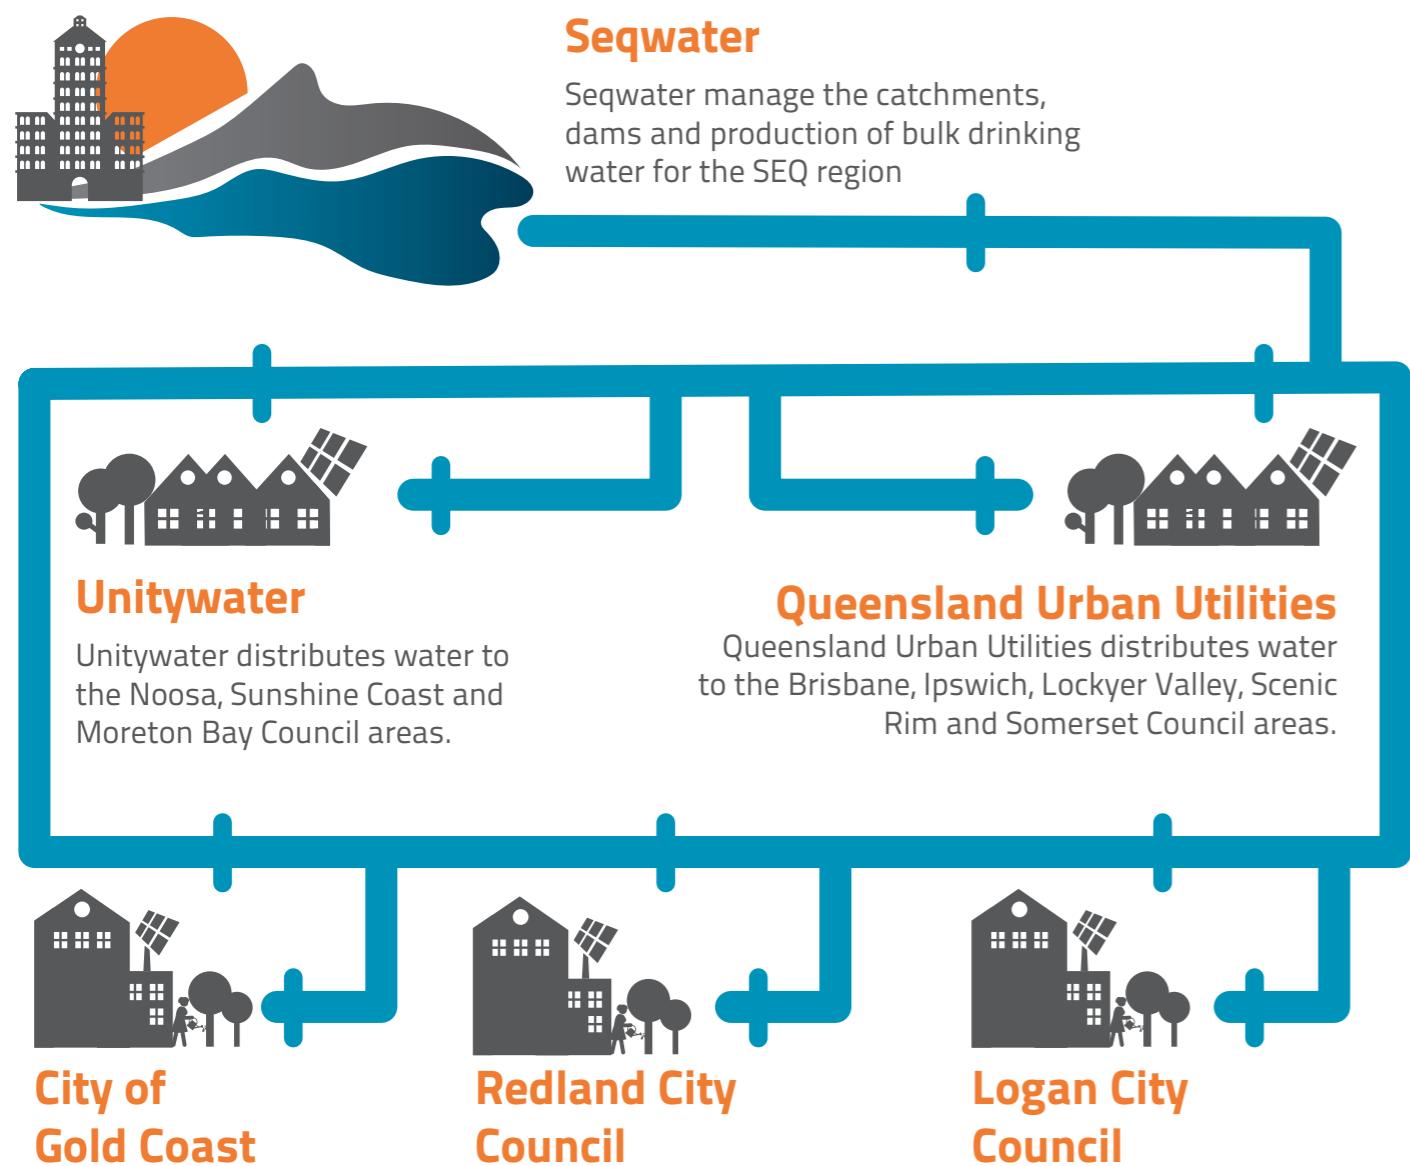

In the meantime further details of the physical and chemical qualities of the drinking water supplied are provided in the Water Quality Summary later in this report. If you have any questions, or feedback on the content of this report, please do not hesitate to call our customer contact centre on 1300 0 UNITY.

George Theo  
Chief Executive Officer  
Unitywater

# Where we sit in the Grid

The south-east Queensland water grid connects the water supplies from the Sunshine Coast, through greater Brisbane and down to the Gold Coast. This arrangement allows Seqwater to move treated 'bulk' drinking water from one area to another, reducing the risk of any single source being used up.

More detail on the bulk water supply network can be found here:  
<http://www.seqwater.com.au/water-supply/supply-network>

# Our supply area

# Water Supply Sources

All of the water treatment plants (WTPs) are managed by Seqwater. Please direct any queries around bulk water supply arrangements to Seqwater (<http://www.seqwater.com.au/contacts>).

## BIBIE ISLAND

Since the shutdown of the Banksia Beach WTP by Seqwater in 2014, the primary sources of water to the island have been the North Pine WTP and the Landers Shute WTP, via the Northern Pipeline Interconnector and the Morayfield reservoir complex.

## CABOOLTURE

The Caboolture water supply region is geographically our largest water supply area, extending from Elimbah in the north to Narangba in the south, west to Wamuran and east to Sandstone Point. Beachmere and Deception Bay are also part of this supply area. There are two typical sources of water for the Caboolture region; Landers Shute WTP and North Pine WTP. Treated water travels through the Northern Pipeline Interconnector, and into reservoirs at Elimbah, Morayfield and Narangba. From here, water is distributed throughout the supply scheme.

## CALOUNDRA

The Caloundra water supply region extends from Point Cartwright (Buddina) in the north, to Pelican Waters in the south, and inland to Bells Creek. The main source of water for Caloundra is the Landers Shute WTP, with supplementary supply from the Northern Pipeline Interconnector if required. Water from the two sources is mixed in the Sugarbag Road reservoir complex prior to distribution to customers. The Ewen Maddock WTP is also available as a drought contingency option; however this plant did not operate in the 2014-15 financial year.

## DAYBORO

Dayboro is not connected to the South East Queensland water grid. Water is treated at the Dayboro WTP, and distributed to the township. Water can be imported via water tankers if necessary.

## KENILWORTH

Kenilworth is not connected to the South East Queensland water grid. The single source of water for this scheme is the Kenilworth WTP. Water can be imported via water tankers if necessary.

## MALENY

The single source of water for the Maleny township is the Landers Shute WTP.

## MAROOCHY NORTH

This region includes Nambour, Eumundi, Bli Bli and Coolum. The main source of water is the Image Flat WTP, with supplemental supply from the Northern Pipeline Interconnector.

## MAROOCHY SOUTH

The Maroochy South region includes the area to the south of the Maroochy River and north of the Mooloolah River, and inland almost as far as Nambour. The main source of water is the Landers Shute WTP, with supplemental supply available from the Northern Pipeline Interconnector.

## NOOSA

The Noosa water supply region extends inland and includes Tewantin, Cooroy, Pomona and Cooran. The main sources of supply are the Noosa WTP and the Northern Pipeline Interconnector. Water is blended within the reticulation system and distributed to customers.

## PINE RIVERS NORTH

The Pine Rivers North region extends from Dakabin to the north to Lawnton in the south, and across the Bruce Highway to North Lakes and Mango Hill. Water to the Pine Rivers North region is currently supplied solely from the Petrie WTP, although there is a planned future connection to the Northern Pipeline Interconnector.

## PINE RIVERS SOUTH

This supply region includes Bray Park, Brendale, Strathpine, Eaton's Hill, Albany Creek, Samford and the Hills District. Pine Rivers South typically receives the majority of its water from the North Pine WTP with an additional small volume from the Northern Pipeline Interconnector. When North Pine WTP is offline for maintenance, water can be supplied from Brisbane via the Aspley reservoir system.

## RAILWAY TOWNS

This water supply region gets its name from the fact that the main townships are all linked by the Sunshine Coast train line. The usual source of water for the Railway Towns is the Landers Shute WTP; however supplemental water supply can also feed in from the Northern Pipeline Interconnector. Water travels first through Mooloolah, before being supplied south to Landsborough, Beerwah, Glasshouse Mountains and Beerburum.

## REDCLIFFE

The Redcliffe water supply region encompasses the entire Redcliffe peninsula, including Rothwell (however Deception Bay is part of the Caboolture supply region). The primary supply source for this region is the North Pine WTP, with a small additional volume from the Northern Pipeline Interconnector.

Queensland Urban Utilities' Bracken Ridge reservoir also supplies a small but steady volume of water into the region via the main that crosses the Houghton Bridge. There are storage reservoirs at Margate and Rothwell, from where water is distributed to customers.

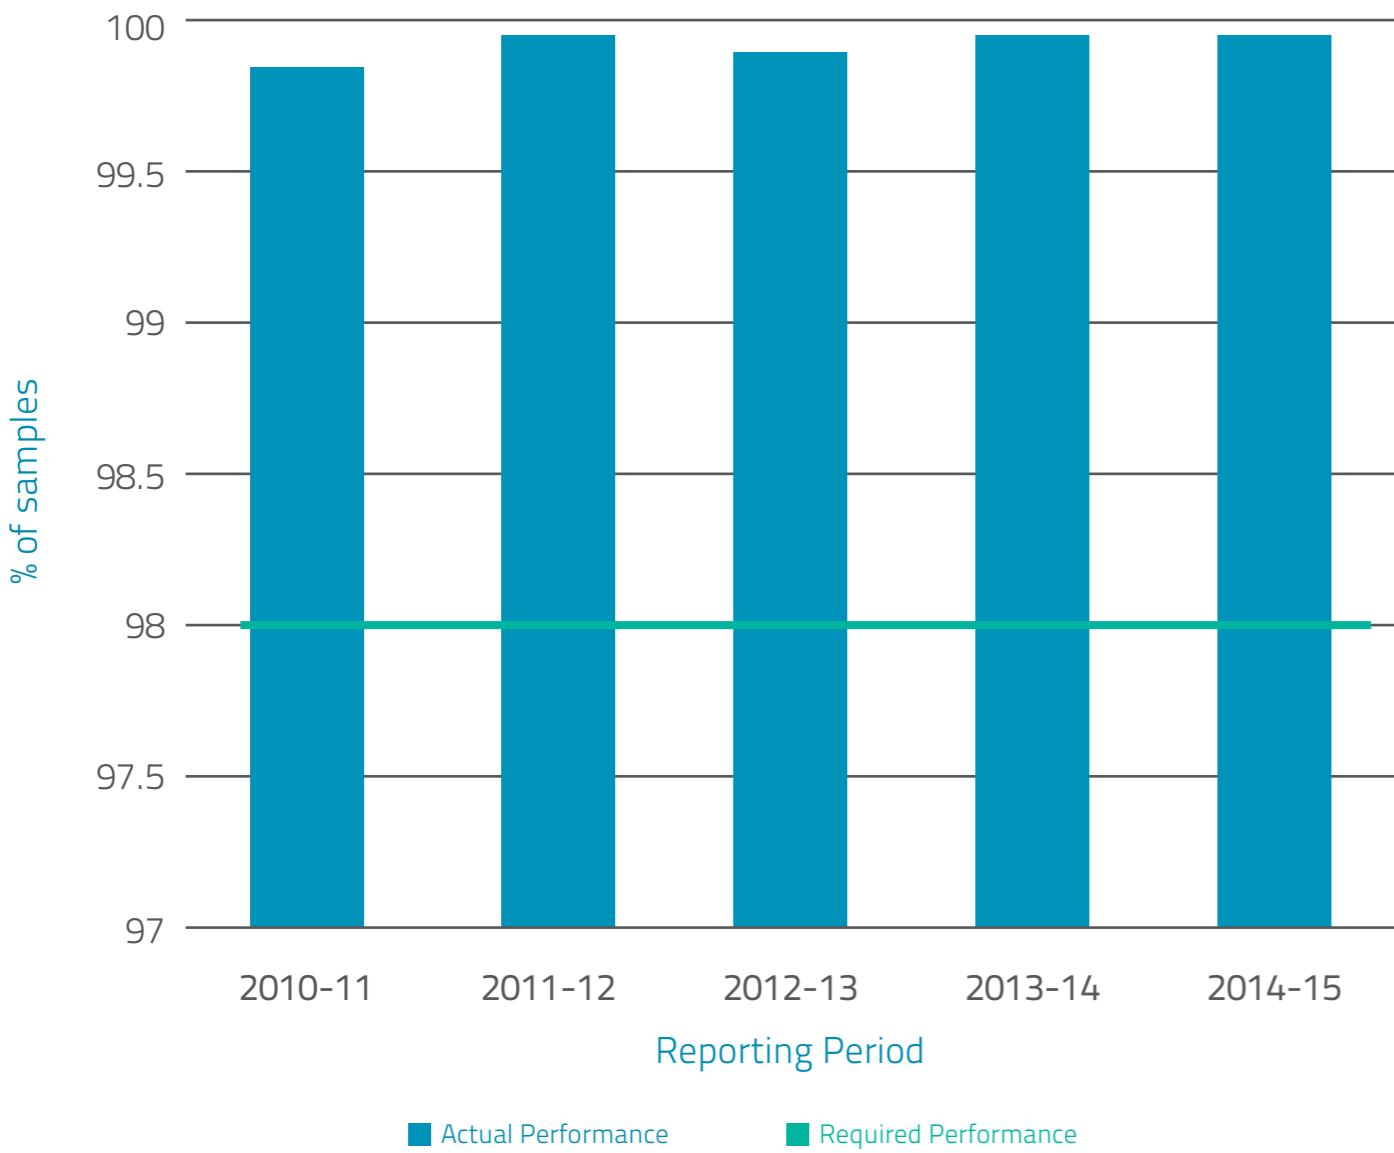

## WOODFORD

The Woodford water supply region is supplied by the Northern Pipeline Interconnector, typically with water that originated from either Landers Shute WTP or North Pine WTP. Water enters the Woodford system via the Elimbah reservoir located within the Caboolture supply region.

# Water Quality Summary

The *Public Health Regulation 2005* requires that all water service providers in Queensland meet the regulated drinking water quality standard; which is that more than 98% of all samples tested must return a negative result for *E. coli*.

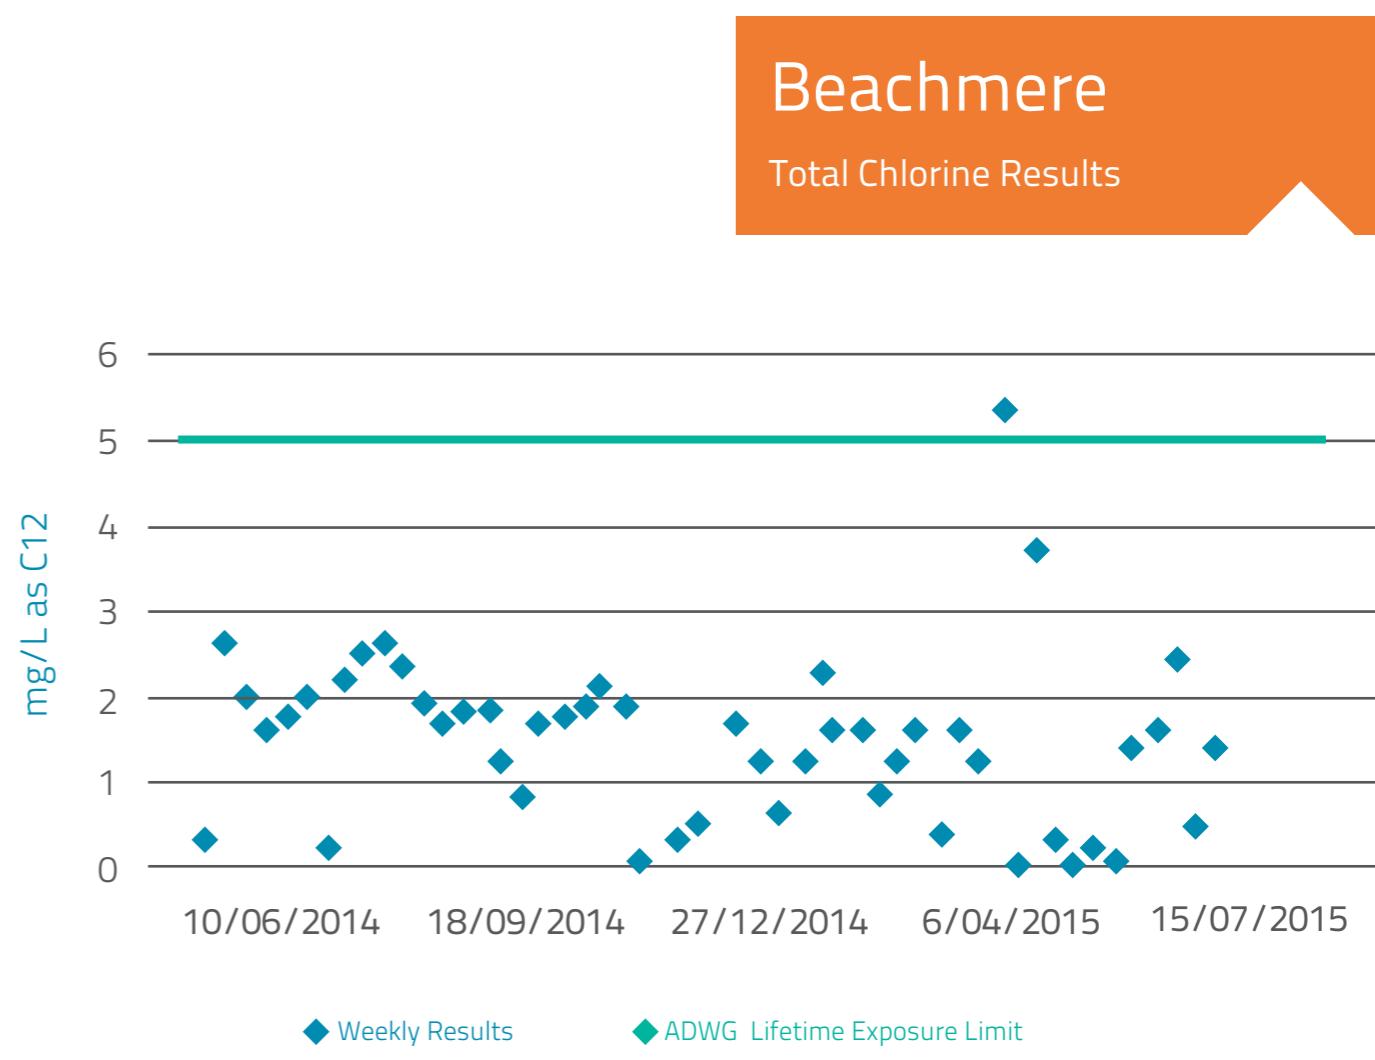

In 2014-15, 99.94% of Unitywater's samples were negative for *E. coli*. The graph below shows our performance over the past five years:

# Water Quality Summary

Unitywater, like other water service providers in Australia, is also obligated to provide customers with water that meets the health related limits as specified in the Australian Drinking Water Guidelines (ADWG) 2011. In 2014-15, there was one instance where the ADWG long term health limit was not met for chlorine at a reservoir in Beachmere. One operational issue resulted in total chlorine measured at 5.4mg/L against an ADWG limit of 5.0mg/L. This was resolved quickly with no long term impacts.

It should be noted that the ADWG limit is based on long-term exposure at the guideline level; meaning that it is considered safe to consume water with 5.0mg/L chlorine for a lifetime. Given that drinking water usually contains chlorine at levels well below the guideline limit (refer to the graph below), a short term exceedance is not considered to represent a health impact by health authorities. If you would like to seek further assurance on this point please contact Queensland Health on 13 HEALTH (13 43 25 84).

# Drinking water quality performance - overview

The table below briefly summarises drinking water performance across three categories, by each supply region.

Supply Region	Microbiological Performance	Chemical (Health) Performance	Chemical (Aesthetic) Performance
Bribie Island	✓	✓	✓
Caboolture	✓	✓	✓
Caloundra	✓	✓	✓
Dayboro	✓	✓	✓
Kenilworth	✓	✓	✓
Maleny	✓	✓	✓
Maroochy North	✓	✓	✓
Maroochy South	✓	✓	✓
Noosa	✓	✓	✓
Pine Rivers North	✓	✓	✓
Pine Rivers South	✓	✓	✓
Railway Towns	✓	✓	✓
Redcliffe	✓	✓	✓
Woodford	✓	✓	✓
<b>All Schemes</b>	<b>5389</b>	<b>3</b>	<b>98%</b>
			<b>99.94%</b>

✓ means that performance requirement was met

**Microbiological performance** is said to have met the performance requirement if more than 98% of samples from the supply region returned a nil result for E. coli.

**Chemical (Health) performance** is said to have met the performance requirement if the 95th percentile (a statistical calculation) for each chemical is below the Australian Drinking Water Guidelines health value for that chemical.

**Chemical (Aesthetic) performance** is said to have met the performance requirement if the average result for each chemical is below the Australian Drinking Water Guidelines aesthetic value for that chemical.

# Microbiological performance in detail

Supply Region	Number of Samples	Number of Positive Results	Required E. coli Performance	Actual Performance	Met PHR
Bribie Island	130	0	98%	100%	✓
Caboolture	775	2	98%	99.7%	✓

PHR = Public Health Regulation 2005

There were three low level detections of E. coli in 2014-2015. E. coli is an organism used as a potential indicator of water contamination but which can also sometimes be found in the natural environment. In all cases we investigated the circumstances around these detections and did not identify any source of contamination. Investigative water quality sampling undertaken at the time did not return any additional E. coli results, which would suggest that these events were transient in nature and do not represent any systemic issues with the water supply.

# Chemical performance in detail

## Bribie Island – Chemical (health) performance

Parameter	Units	Number Of Samples	Min Result	Max Result	Average Result	95th Percentile	ADWG Guideline	Met ADWG
Antimony	mg/L	1	<0.001	<0.001	<0.001	<0.001	0.003	✓

a - No guideline limit for Colour (Apparent)

b - ADWG guideline limit is for 600mg/L as total dissolved solids. This is approximately equal to a conductivity of 1000µS/cm.

c - No guideline limit for Temperature

# Topic in focus:

## Chlorine why does it matter?

Chlorine is a chemical which has been used in water treatment since the late 1800s. It can be added to water in gaseous, liquid or solid form, and is a very powerful disinfectant. The main objective of adding chlorine to water is to kill or inactivate harmful microorganisms which may be present in the "raw" water, which if left untreated could cause illness to the general population. Generally, the most vulnerable groups are the very old, very young, and those who have weakened immune systems due to other illnesses or illness treatments.

**“** Disinfection is of unquestionable importance in the supply of safe drinking water. The destruction of pathogenic microorganisms is essential... **”**

World Health Organisation 2011 - Guidelines for Drinking Water Quality.

There are two main aspects to manage when using chlorine in water. These include:

- ▶ Disinfection by-products. These are a range of chemicals which can form when chlorine reacts with natural organic matter in the water. Above certain levels these by-products can be harmful to health; however levels of disinfection by-products in Unitywater's water supply systems are low.
- ▶ Taste. The level of chlorine required to provide a disinfectant residual is often above the taste threshold for many people. This taste can be described as "metallic", "chemical" or even "like bleach" in some cases. We find that most of our calls regarding chlorine taste in water are from customers who have only recently moved into the area. If you are particularly sensitive to the taste of chlorine, consider filling a bottle with water and including a

slice of lemon... the lemon will instantaneously react with the chlorine and remove the unwanted taste!

The advantages of chlorination cannot be overstated. The World Health Organisation estimates that more than 500,000 deaths per year are caused by contaminated drinking water. If water was able to be adequately treated and disinfected, most if not all of these deaths could be prevented.

**“** The greatest risks to consumers of drinking water are pathogenic microorganisms. Disinfection is the single process that has had the greatest impact on drinking water safety. There is clear evidence that the common adoption of chlorination of drinking water supplies in the 20th century was responsible for a substantial decrease in infectious diseases. **”**
